

# Model Train<sup>TM</sup> TECHNOLOGY

---

## *Speed Stick*<sup>TM</sup>

### Troubleshooting

1. I placed the ST on my layout, and it shows 330mph and won't get to ready.

**The ST must be raised off the table by the enclosed FEET, otherwise the sensor sees the tabletop, or in some cases the track roadbed.**

2. After Auto Calibration, the directional arrows just bounce back and forth.

**Turn power off, then on to reload the calibration settings.**

3. **After Auto Calibration, you may have to adjust the distance between the ST and the track. Sometimes the auto calibrate results in a shorter range than you expected. Simply auto calibrate a few mm further away and then move the ST closer after the calibration.**
